Power BI Dashboard Analysis

Submitted as a dashboard-based business analytics report

1. Introduction

This report explains the retail sales dashboard shown in the supplied screenshots. The dashboard brings important business measures into one place and presents them through KPI cards, charts and interactive filters. It helps a user understand overall revenue, cost, profit, transaction volume, quantity sold and the performance of different stores, cities and product categories.

2. Objectives of the Dashboard

The main objective is to convert sales data into clear information that supports business decisions. The dashboard is designed to:

- Monitor key sales and financial performance indicators.
- Compare revenue across product categories, stores and cities.
- Understand the contribution of different store types.
- Observe monthly revenue movement over time.
- Filter the results by date, customer segment, store and state.

3. Dashboard Overview

The report contains two main views: a KPI summary page and an interactive dashboard page. The KPI view gives a quick snapshot of the overall business. The interactive page adds charts and slicers so that the user can explore the figures in more detail. The screenshots show a date range from 12 January 2024 to 11 January 2026 in the interactive view.

4. Key Performance Indicators (KPIs)

The KPI cards display the headline measures visible in the supplied dashboard. The values below are reproduced as displayed in the screenshots.

KPI	Displayed value	Meaning
Average Order Value	313.80K	Average value associated with an order.
Total Cost	4bn	Overall cost recorded for the sales activity.
Total Profit	979.89M	Profit generated after accounting for costs.
Total Revenue	4.71bn	Total sales income generated.
Total Transactions	15K	Number of recorded transactions.
Total Quantity	112K	Total quantity of products sold.

Interpretation: The dashboard reports total revenue of 4.71bn and total profit of 979.89M. These headline values allow management to review business performance quickly. The currency and calculation definitions are not visible in the screenshots, so the figures are retained in the same abbreviated format shown by the dashboard.

5. Visual Analysis

5.1 Total Profit by Category

The treemap compares profit across product categories. Mobile Phones and Laptops occupy the largest visible areas, suggesting that they contribute strongly to total profit. Televisions also have a notable share, while Home Appliances and Audio occupy smaller areas. Smaller categories such as Wearables and Accessories have comparatively limited visual representation.

5.2 Total Revenue by Store Name

The horizontal bar chart compares revenue for individual stores. Bengaluru Orion and Pune Phoenix appear among the leading stores in the visible chart, followed by Chandigarh Mall, Pune Amanora, Hyderabad Inorbit, Mumbai Phoenix and the Online Store. This view helps compare branch-level performance.

5.3 Total Revenue by Category

The category column chart shows Mobile Phones as the highest revenue category, followed by Laptops and Televisions. Home Appliances, Audio, Wearables and Accessories contribute smaller amounts. This suggests that revenue is concentrated in a few major product groups.

6. Store Type and Geographic Analysis

6.1 Total Revenue by Store Type

The doughnut chart divides revenue among Urban, Flagship, Mall, Online, Suburban and another urban-labelled segment. The largest visible share is Urban at approximately 38.87%, followed by Flagship at approximately 23.84% and Mall at approximately 15.98%. Online and Suburban represent smaller portions. The repeated-looking 'Urban' and 'urban' labels should be checked in the source data because they may represent inconsistent category naming.

6.2 Total Revenue by City

The city chart compares revenue across locations including Pune, Mumbai, New Delhi, Bengaluru, Chandigarh, Hyderabad, Online, Chennai, Gurgaon and Noida. Pune appears as the leading city in the visible chart, with Mumbai and New Delhi also showing strong revenue. The chart helps identify locations that may need additional stock, marketing or operational support.

7. Monthly Revenue Trend

The line chart displays total revenue by year and month. Revenue changes from month to month rather than remaining constant. The visible trend includes rises and falls across 2024 and continues into 2025. Reviewing this chart over time can help identify seasonal patterns, stronger sales periods and months that require closer investigation.

8. Interactive Filters

The dashboard includes slicers for full date, customer segment, store name and state name. A user can select a date range or a particular customer group, store or state. The charts and KPI cards can then be explored for the selected portion of the data. This makes the dashboard useful for both an overall review and a focused analysis.

9. Dashboard Screenshots

The following screenshots are included as visual references for the KPI summary and interactive dashboard layout.

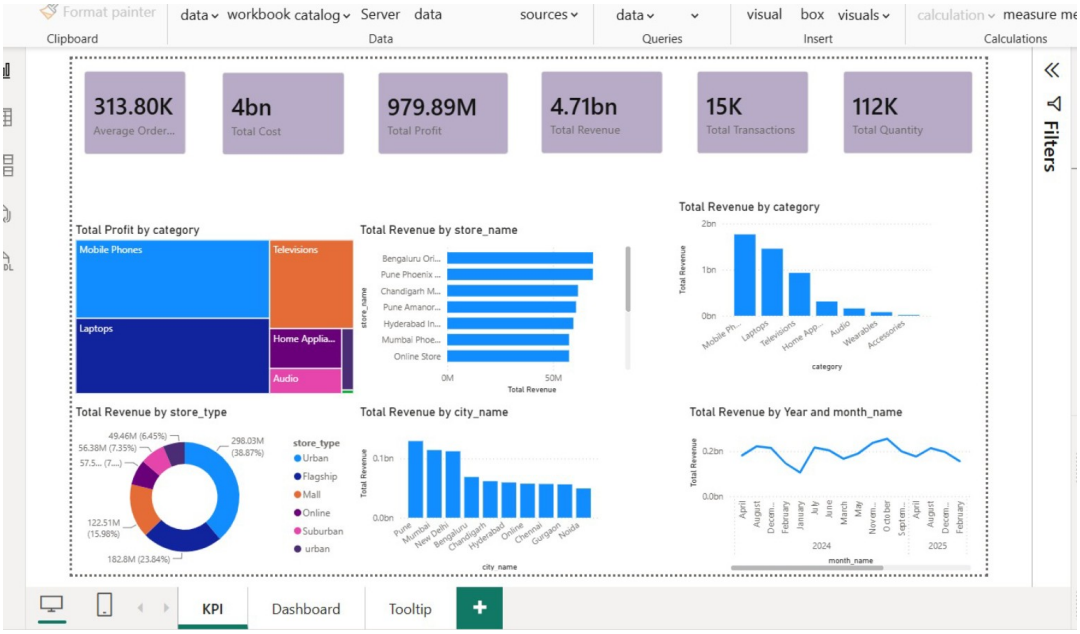

Figure 1. KPI summary view with headline business measures and charts.

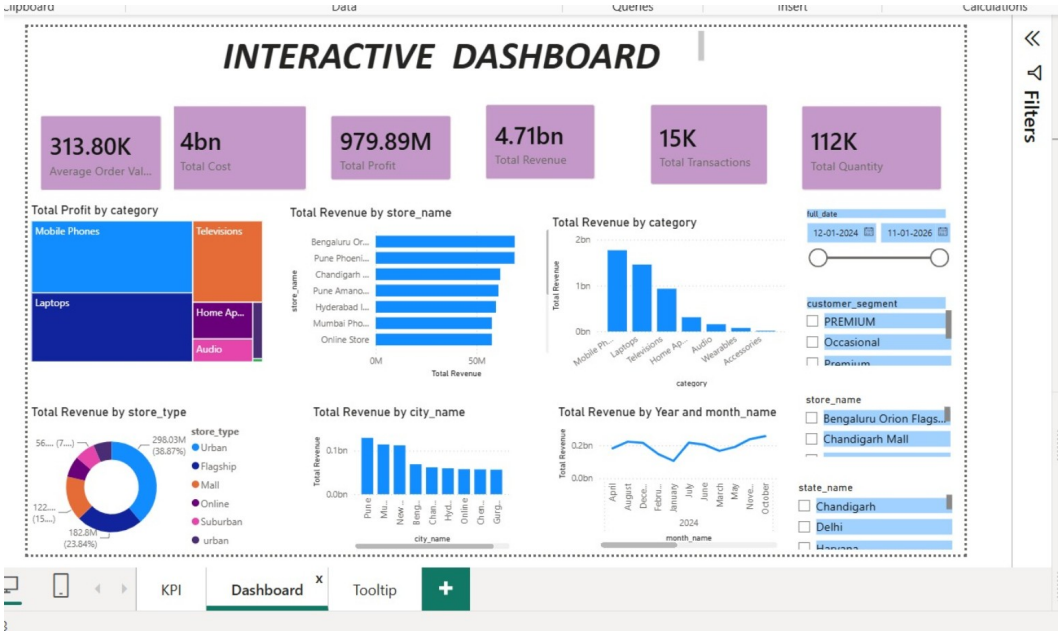

Figure 2. Interactive dashboard with date, customer, store and state filters.

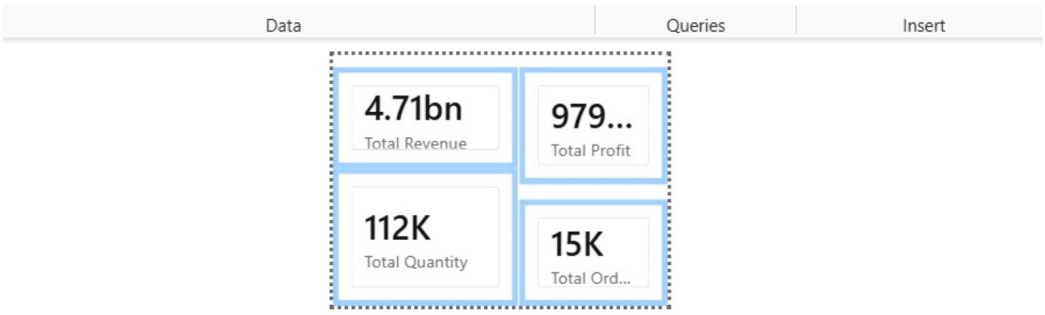

Figure 3. KPI card layout highlighting revenue, profit, quantity and transactions.

10. Major Findings

• Total revenue is displayed as 4.71bn, while total profit is 979.89M.
• Mobile Phones and Laptops are leading categories in the visible revenue and profit charts.
• Bengaluru Orion and Pune Phoenix are among the strongest visible stores by revenue.
• Pune is the leading city in the visible city comparison.
• Urban stores form the largest visible store-type share, followed by Flagship and Mall.
• Monthly revenue fluctuates, making trend monitoring important.

11. Suggestions and Recommendations

1. **Focus on leading categories:** Maintain adequate inventory and effective promotions for Mobile Phones and Laptops, while reviewing the growth potential of smaller categories.
2. **Study high-performing stores:** Identify the practices used by leading stores and consider applying them to branches with lower revenue.
3. **Improve location-based planning:** Use city-level results to plan stock allocation, local campaigns and staffing.
4. **Monitor monthly movement:** Review sudden increases or decreases in revenue and investigate the reasons behind them.
5. **Clean category labels:** Standardise store-type names such as 'Urban' and 'urban' to avoid duplicate-looking groups.
6. **Clarify KPI definitions:** Add currency symbols, units and calculation definitions, especially for Average Order Value, cost and profit.

12. Conclusion

The retail sales dashboard provides a consolidated view of business performance through KPI cards, charts and interactive filters. It helps users understand revenue, cost, profit, transactions and quantity sold, while also comparing product categories, stores, cities and store types. The dashboard can support better decisions about inventory, marketing and store operations. For more reliable analysis, the underlying data should use consistent category names and clearly documented KPI definitions.

13. Scope and Note

This report is prepared from the supplied screenshots. The underlying workbook or dataset was not provided for independent recalculation. Therefore, the observations describe only the values and chart patterns visible in the screenshots; they should not be treated as an audit of the source data.
